ABSTRACT OF THE DISCLOSURE

now The lining of a lateral pipe which leads into a main pipe is achieved by everting a resin impregnated tubular lining through an elbow in the main pipe, eversion being accomplished by <sup>a</sup> means of fluid under pressure supplied through a pressure pipe, the elbow being held in position by an inflatable bag which is inflated by said fluid, the bag sealing the lateral/main pipe junction, and the bag being such that at least one additional pressure pipe may extend past the seal arrangement so that at the same time that the first mentioned lateral lining is curing a second lateral may be similarly lined.
